

Selection Manager

This code snippet shows how to select visualization elements via a program.

Product Description

This example show how the `SelectionManager` is used to select visualization elements via a program.

Technical Description

The program `SelectionHandling` evaluates the events from the buttons 'Up', 'Down', 'Left', 'Right' and 'Click' for the first visualization client.

The method `SelectNextElement` will change the current selection. If the button 'Click' is pressed, then a mouse-up event is fired for the selected element and is displayed as 'LastClick'.

The function 'SelectElementAt' selects the element with the element-id entered in the field above.
